SUBJECT-MATTER OF THE PUBLIC CONTRACT

The subject of the 1st part of the public contract is the supply of vacuum pumps including their accessories. The detailed technical specification is set out below in Article 2(2.2) of this Documentation. The system will be used for the study of the interaction between light and matter and molecular spectroscopy. The vacuum pumps will be used to create and maintain a vacuum in a radio frequency trap chamber designed to simultaneously trap atomic and molecular ions and implement protocols using quantum logic with applications in molecular spectroscopy.

The molecular ion will serve as the spectroscopic ion whose spectrum will be investigated, and the atomic ion will be used for laser cooling and to read the spectroscopic information. The ions will be coupled to each other via near ground state modes of motion.

For this type of research, it is crucial to achieve ultra-high vacuum or extremely high vacuum to isolate the trapped ions from the effects of collisions with other elements that make it difficult to trap the ions themselves, shorten the trapping time, and prevent coherent preparation and study of ion motion.
